Note:
Handled nonfatal crosswalk-support conditions are reported in the diagnostics and do not block the ADH-mainland estimating sample. Each coefficient is the interaction between import-exposure measure and the indicated presidential-election year, with 1988 omitted as the reference year. Exposure is measured in thousand dollars per worker. The depend commuting-zone Republican presidential vote margin, defined as Republican minus Democratic votes divided by two-party votes. County presidential returns are from Amlani a bridged to 1990 counties with the Ferrara, Testa, and Zhou (2024) M2 weights where valid, with M2 fallback for source counties whose selected weights are undefined or invalid, t 1990 commuting zones. Standard errors use CZ-clustered. Significance stars: *** p¡0.01, ** p¡0.05, * p¡0.10.
