

Table 1: Provisional validation-warning Event-study estimates: ADH China exposure and Republican presidential vote margin

Election year	Minimal	Interacted controls
1972	0.000 (0.002)	0.002 (0.002)
1976	-0.007* (0.004)	-0.004 (0.003)
1980	-0.007* (0.004)	-0.001 (0.002)
1984	-0.001 (0.001)	-0.000 (0.001)
1988	—	—
1992	-0.003*** (0.001)	-0.004*** (0.001)
1996	-0.002 (0.002)	-0.007*** (0.002)
2000	-0.001 (0.003)	-0.007** (0.003)
2004	-0.000 (0.003)	-0.006** (0.003)
2008	0.002 (0.004)	-0.002 (0.003)
2012	0.003 (0.005)	-0.002 (0.003)
2016	0.008 (0.007)	-0.001 (0.003)
2020	0.009 (0.006)	-0.002 (0.003)
Observations	9,386	9,386
Commuting zones	722	722
Election years	1972–2020	1972–2020
Reference election year	1988	1988
CZ fixed effects	Yes	Yes
Election-year fixed effects	Yes	Yes
Controls	None	Configured 1990 ADH baseline controls interacted with election-year indicators
Sample	main_1972_start	main_1972_start
ADH weights	timepwt48	timepwt48
Main SE type	cluster_cz	cluster_cz

Note:

PROVISIONAL: at least one validation check failed or a numerical repair/warning was recorded; treat these as diagnostic output until reviewed. Each coefficient is the interaction between ADH’s 1990-2007 import-exposure measure and the indicated presidential-election year, with 1988 omitted as the reference year. Exposure is measured in thousand dollars per worker. The dependent variable is the commuting-zone Republican presidential vote margin, defined as Republican minus Democratic votes divided by two-party votes. County presidential returns are from Amlani and Algara (2021), bridged to 1990 counties with the Ferrara, Testa, and Zhou (2024) M5 weights where valid and policy fallback_m2 for source counties whose selected built-up-support weights are undefined or invalid, then aggregated to 1990 commuting zones. Standard errors use cluster_cz. Significance stars: *** p<0.01, ** p<0.05, * p<0.10.
